Panoramics of question

- Problem statement
  - Why this problem?
  - Why this problem it is **relevant**?
  - To whom is this problem relevant?
  - What are the **open themes i**n the area of knowledge you are exploring?
  - How is the data you are using able to solve this kind of questions?\

Causes of deforestation

- Causes of deforestation
  - Human factor : agriculture, infrastructure
  - Urban developement
  - Industry
  - Expansion of farming land
  - Forest and other plantation
  - Logging and fuel wood
  - Overgrazing
  - Mining
  - Urbanization/industrialization and infrastructue

Causes of deforestation cont.

- Air pollution
- role of the military
- Tourism
- Colonialism
- Explotaition by industralized countries
- Over population and poverty

Brief Introduction

The (de)-forestation is the transformation of forest land to a soil that the human can be use for his plan.

This phenomenon is **human based** and involve different subject, in a micro and macro domain.

The connection between the economic growth. the climate, the amount of Co2 that is absorbed in a large scale. Also economically we can see to the massive cultivation and farming. These aspect are strictly correlated. If increases the global temperature, then will rise the prices of the food produced, like milk for example.

Why this problem?

- This problem, like we can see examinaming in my next slides, of deforestation or about the forest soil has a global impact in the socio-economics scenario and also in quotation about the antropological question and trade off open about Nature vs Culture. This process of deforestation, indeed,is caused by the human's hand, trying to maximize the industrial parameters of profit, and the economics politics that tries to develop in a globalization scenario.

Why this problem?

- The human factor is crucial because, like is said by a wwf report about deforestation, is observed that the 90% of deforestation is caused by the sovra-alimentation of food in the world, and not only by the alimentation of farmers animal,(massiv farming), that is other factor. It is estimated that every people has a quantity of land of forest of wich is responsible directly. This scenario, that is described in term of life-style , should be make anyone be more responsable of the individual and group behavoiu r

Stake Holders

Are individual
groups ,
Organizations
they have influence in a organization activities, projects and decisions.
They can be divided in two parts:
- Internal
- External

Internal and External StakeHolders

Internals

- Employees
- Managers
- Owners

External

- Suppliers
- Society
- Government
- Creditors
- Costumers
- Consumers
- Shareholders

Deforestation, some aspects

- The aim of this research is to deliver the meaningful data, in order to have some evidences about the process of deforestation in pair with the government needs to introduce politics to treat the soil in a sustainable way. Also like is proof that the micro-behavioural aspects of the life-style in the globalization societies can increase affected also by all the people that lives in a scenaio of over-alimentation

Research questions

- What are the question you are asking to your dataset?
- What kind of method do you want to use?

Analysis

- What are the numerical results? Are they reliable, are they robust, can you trust them?

Deforestation

- The irreversible process to remove or fire out the trees from forest to other kind of landscape that will be used my humans.
- Sometimes is correlated to a climate aspect, such as from drought and flood.

Also is contributed by the **industrialization**, one can be addressed to farmer industry, the mining of natural resources. The expansion of **agriculture** land dedicated. Also are expanded the **road map** for linking the countries for autovehicles.

Consequent of deforestation

- Deforestation may causes the loss of biodiversity,
- Air pollution
- Global Warming
- let's see other causes of deforestation
- Production of wood
- Farm animals
- Extraction of minerals

Agro-forested Political

WWF has estimated that the 90% of the causes of deforestation is caused by the human alimentation.
So we need some policy to soil conservation from the degradation and erosion, it should be remain fertility
It could be encouraged sostainable agriculture, protection of natural resources, improve the water quality, supporting ecosystem, ensuring food security

Deforestation cont.

- Deforestation is a world wide problem. So it have different impact in term of fenonemon in the different mainly geograficals area.
- Burn farmers : is a traditional agriculture method with deforestation and then fired to prepare the coltivation. It makes the soil more fertile.
- Commercial farmes (agricoltur e allevamento intensivo) : those methods maximate the capacity of production from the land

Why the problem (de)forestation

The problem of deforestation is important to treat because represent the relationship between culture and nature. Our Economics system, in simple way are, try to maximixe his reward, often sacrify some importantent resources(natural), like could be the tree in this scenario, in order to sostain the agricolture and massive farming and also related to aspect of human developement.

Why these problem (de)forestation

- The data summarized for the statistics persective, it can be used for the governement and local managing resources istitution in order to have a lead of data to taking important decision based on the trend of (de)forestation and the other KPI's correlated to the superficies of forest. The problem is important to be treat because has a key-role on the economics system all the world (global effect) and the local communities(local effect). It's not automatically mean that both (local and global) has the same behaviour

Project Organization

- Tecnological and tecniques Stack

−Python language, using jupyter notebook from a online services of cloud
−Used to explain the qualitative aspect of data, the numerical function inside the packages of python, and the graphic aspect to show how the fenomen is caracterized (data visualization and plots.
−Used descriptive techniques of statistic to summarize information
−Used machine learning techniques to make a clustering and a regression problem, jontly

Conclusion

What are your answers to the research question?

The research question was : examine the problem of deforestation along a time series in a nation.

IUsing statistics and informatics technics is was seen the italy's trend along the 1861 to 2005, providing all the most analysis exploration of data and identify the parabolic trend that is used as regressor if the socio-politics-aspect should be remain the same. In italy, there is a phenomenon of forestation instead deforestation, but these one is balanced to many fires and loss of trees especially in middle-south italy
